

TIFFEN® Digital Diffusion/FX® Filters

Digital Diffusion/FX Filters for Today's DV Cameras

Digital Diffusion/FX filters make people look better without evidence of filtration. They are similar to the popular Tiffen Black Diffusion/FX without the internal dot pattern. They create a silky smooth look on textured surfaces and suppress facial blemishes and wrinkles while maintaining a clear, overall in-focus image. Made of solid ultra quality glass, these filters offer virtually no highlight flare or reduction in contrast creating a more subtle version of a "film look" for video applications.

Lower densities of the Digital Diffusion/FX offer a more subtle version of the "film look" effect, modest softening, minimal reduction of contrast and fine tuning of the image with higher grades creating stronger effects. This is helpful when different grades of diffusion are required in the same shot or different scenes because the viewer will not see a difference in the overall "look". The "look" is consistent.

Digital Diffusion/FX filters are available in densities 1/4, 1/2, 1, 2, 3, 4 and 5 in professional sizes 4x4, 4x5.650, 6.6x6.6, 138mm and 4-1/2" and will be available in screw-in sizes 52mm-82mm for the digital and still photographer and videographer.
